Acral Anomaly in a Young Boy

August 12, 2016
By Jonathan A. Schneider, DO [1]

Three-year-old boy has rash x7 days on arms and legs plus low-grade fever x10-14 days. Is the eruption anomaly or simply ordinary?

In the after-hours clinic you see a 3-year-old boy whose mother is concerned about a papular rash on the child's limbs, present for about 1 week. She also says he's been running a low-grade fever on and off for almost 2 weeks. PMH is non-contributory and there are no known sick contacts.

What is your first impression on visualizing the rash? Are laboratory tests indicated? What's your diagnosis?
